MARKED-UP VERSION OF AMENDED CLAIMS

1. (Amended) During formation of a concrete wall, a device for supporting a weldment plate, said device comprising:

[a. a] **an elongate** body portion having a length substantially equal to the thickness of the concrete wall minus a dimension of the weldment plate extending in a direction of the thickness of the concrete wall;

[b.] a surface engaging portion for contacting a surface on which the concrete wall is poured and supporting the weldment plate in a position appropriately spaced from that surface; **and**

[c.] means for attaching said **elongate** body portion to the weldment plate**[;],** **wherein [whereby]** the **device is capable of maintaining the** weldment plate **[will be maintained]** in a desired position as wet concrete is poured and sets up.

2. (Amended) The device of Claim 1, wherein said length of said **elongate** body portion is adjustable.

4. (Amended) The device of Claim 2, wherein said **elongate** body portion comprises two components which may be adjusted relative to each other to achieve the desired length.

6. (Amended) The device of Claim 4, wherein said means for attaching **said elongate body portion to the weldment plate** comprises an adhesive layer between said weldment **plate** and one of said components.

17

9. (Amended) The device of Claim 1, wherein the weldment plate includes a plate member and projections extending from the plate member, said means for attaching **said elongate body portion to the weldment plate further comprising** **[comprises]** means **[to secure]** **for securing** said device to a head portion of the weldment projection.

10. (Amended) The device of Claim 9, wherein the projections are Nelson studs welded to the nether side of the plate member and said means for **[attaching comprises]** **securing said device to the head portion of the weldment projections further comprising** a plurality of fingers to capture the head portion of the Nelson stud securing said device thereto.
